

Haoyuan Liu

Full-stack Software Engineer

Menlo Park, CA | hy.liu@berkeley.edu | [Website](#) | [LinkedIn](#) | [GitHub](#)

Education

University of California, Berkeley

08/2018 – 05/2022

B.A. Computer Science, GPA 4.00

Computer Science Major Citation Award, Highest Distinction in General Scholarship

Skills

Languages: TypeScript/JavaScript, Python, Java, Hack/PHP, C, Dart, SQL, HTML/CSS

Frameworks: React, GraphQL, Flutter, Electron, Docker

Experience

Software Engineer, Meta

07/2022 – Present

- Working on [Regulatory Readiness Platform](#) to build AI-driven workflows for legal and policy teams at Meta to ingest, evaluate, and comply with global regulatory requirements at scale
 - Led product experience for agentic Gap and Impact Analysis tool, empowering legal teams to automate and accelerate process of matching legal specs to internal controls from weeks to days
 - Led product experience for Horizon Scan project, enabling policy teams to monitor tens of thousands of global legislations annually and augment internal repository of legal obligations
 - Designed and implemented agent memory and evaluation frameworks for tracking AI / human edits to legal obligations or specs and persist ground truth decisions to steer agentic re-runs
 - Built real-time collaboration systems allowing multiple users and agents to make concurrent edits to rich text legal documents with permission controls and notifications
- Worked on [Federation Platform](#), an infra team that builds internal framework for Meta engineers to efficiently identify privacy and security issues, distribute internal tasks, and complete work in bulk
 - Led design and implementation of Smart Workflow Onboarding tool, a complex web app that builds decision trees for interactive wizards embedded on privacy tasks, allowing engineers to make informed decisions to automatically resolve issues with code-based logic
 - Transformed >95% of privacy tasks that Meta engineers collectively spent 10% time on to adopt Smart Workflows, saving tens of thousands of engineering hours annually

Independent Developer / Open Source, Fluent Reader

05/2020 – Present

- Sole maintainer of [open source projects](#) on GitHub with over 10,000 stars combined
- Developed [Fluent Reader](#), a modern and polished desktop RSS news reader built with Electron, React, and TypeScript with over 350,000 downloads from Mac App Store, Microsoft Store, and GitHub
- Built [Fluent Reader Lite](#) mobile client app with Flutter and published to App Store and Google Play

Software Engineer Intern, DoorDash

05/2021 – 08/2021

- Built a new order tracking page with React and GraphQL for [DoorDash Storefront](#), a white-labeled version of the online-ordering platform allowing merchants to use their own branding
- Worked across teams to implement product features, bug fixes, and unit / E2E tests spanning multiple codebases including React frontend, Node.js backend-for-frontend, and Kotlin microservices

Undergraduate Student Researcher, UC Berkeley EECS Department

09/2020 – 11/2021

- Designed a domain-specific programming language for graph analysis in computer networking and implemented its interpreter with ANTLR, Java, and Postgres. Paper accepted by VLDB 2025.

Publications
